

A government organization intends to develop a software system for processing and managing citizen service requests. The system must comply with strict regulatory standards, ensure high reliability and security, and undergo thorough verification and validation before deployment. The requirements are formally documented and are not expected to change frequently, but any failure could have serious legal and operational consequences.

- a) Choose any one suitable prescriptive process model for this project. Justify your choice by explaining with a neat diagram on how the selected model's characteristics help in handling regulatory compliance, quality assurance, risk, and controlled delivery. (4 marks)
- b) Which prescriptive process model might not be a suitable model for this project? Support your answer with reasons. (2 marks)
- c) Describe if Agile principles can be a fit to this project or not. (2 marks)
